1. Foreword

This is the 2016 version of Woodlarks Camp Site Trust's tree safety policy. There are no significant changes from the previous version.

It was written by Tim Dicker.

This document sets out the principles and plans for carrying out tree safety management (TSM) at Woodlarks Campsite Trust, to ensure the Trust implements an effective but reasonable approach to tree safety. It lies on a base of good woodland management and aims to implement a more specific approach to TSM by zoning and systematic survey/tree work. However, it cannot guarantee absolute safety – trees are living organisms and not all safety issues can be identified or predicted.

2. Planning, Implementation, Monitoring & Reporting

The key means of managing the tree safety will be by a regular and systematic approach to TSM to ensure key areas are surveyed and actioned within appropriate periods. The plan provides the following:

Identifies all areas of the site that require routine survey and work.

- Details the frequency of survey expected.
- Identifies who is responsible for the survey.
- Records when it was last surveyed.
- Specifies remedial action.
- Records when the required work was completed.
- Records any ad hoc work identified and undertaken outside routine survey.

The zones are described below. They may need reviewing and if facilities and time allow a digital map will be created.

3.Zoning & Survey Frequency

The site is divided into 2 zones and recorded on a map (see back of document).

Zone 1 (highlighted features as noted by colour on map)

- To be inspected in detail each year and recorded in writing. (the frequency may be adjusted where justified/evidenced). The zones are:
 - Site boundaries against the public highway (these trees are individually tagged)
 - Trees surrounding or within the two main camping areas, car parks and around two main fields (normally called the top and lower fields)
 - Camp fire circles.
 - Aerial runway.
 - Woodland paths.
 - Pool area.

Zone 2 (all other areas on the map not identified on map)

- To be inspected at least once every 5 years and recorded in writing. It is also expected that due to the small size of the site, ad hoc 'inspections' will take place whilst other woodland and site management is carried out. For example, whilst thinning work is completed, trees of poor health will be removed as part of the operation.

4. Roles and Responsibilities

Tim Dicker, as Committee Member with responsibility for the grounds, is responsible for managing the TSM programme, and ensuring:

the zoned areas are surveyed at the correct frequency, to a consistent standard.

- work identified is carried out within the appropriate timescale.
- appropriate resources are used to deliver the programme effectively and efficiently.

A competent person, as agreed with Tim Dicker, will undertake:

the survey.

recording tree safety issues that they find during the survey.

to report back to the management committee.

supporting colleagues on tree safety issues that affects other WCST activities.

- implementing / overseeing / managing tree work identified by the survey.

Naturally, other site users, Committee Members and Trustees have a duty of care to report dangerous trees to Tim Dicker.

5. Liaison

Statutory Stakeholders

There may be occasions where tree work affects a designation. This should be highlighted on the inspection form where known, and liaison with statutory bodies done before the work programme begins to ensure they are informed or formally consulted. Typically, stakeholders may include:

- Natural England – tree work affecting AONB (Surrey Hills Area of Outstanding Natural Beauty) and EPS (European Protected Species)
- Local District council – Tree Preservation Orders

Neighbours

We should keep our neighbours aware of any major work or implications to provide assurance that we take our responsibilities seriously and ensure they recognise the importance of this work.

6. Tree safety survey

Who carries out the survey?

It is expected that the surveys will be completed by volunteers who have a relevant background or knowledge to effectively undertake the duty. Paid contractors may be used for survey work where resources or circumstances are such that WCST volunteers are not available.

Skills required for survey work

All volunteers carrying out survey should have a degree of knowledge but do not have to have attended a specific tree safety management course. For specific issues or to survey trees with high amenity value volunteers or contractors with appropriate qualifications should undertake the survey.

7. Survey

Timing of the survey

The aim is to carry out surveys at the optimum time for identifying potential problems with the trees and carrying out tree work outside bird nesting season – this suggests surveying in autumn when fungal fruiting bodies are present. However, due to the grounds being used through the summer it is intended that the main survey will be completed in late winter. This will allow any damage caused by the winter weather to be identified and dealt with prior to the camping season.

Whilst this may be the ideal time, intermediate surveys may be required soon after freak inclement weather.

Scope of the survey

The survey should include all trees on WCST land. For Zone 1 the survey will be quite detailed and if appropriate on an individual tree basis. It will be carried out by walking the route/area.

For other zone 2 areas the survey will normally be carried out in a bid to identify more general hazards e.g. leaning / broken trees, dead limbs and tree wounds. Due to the small scale of the site it is sensible to undertake this on foot.

Survey Method

Surveyors should be equipped with the following:

- Maps at an appropriate scale.
- Survey forms.
- Spray cans.
- Tree number tags, hammer, nails and safety glasses.
- High viz jacket for surveys near roads.
- Safety helmet for surveys during or after storms.

A risk assessment for tree surveys is in appendix 9.1.

Recording trees that require work

Surveyors must ensure trees identified for safety work are easy for others to find. Normally this will be achieved through:

- annotated maps showing the location of the tree.

- tree number tags (nailed to the tree as high as possible ~2m).
- spray paint
- accurate tree description on the survey form

The survey form in appendix 9.2 must be used to record details of the tree, the work required, and degree of urgency, plus operational aspects such as traffic management and tree surgeon requirements.

When considering options for work that may be required, there are 3 key factors:

- the hazard and risk.
- the environmental and amenity value of the tree.
- the cost of work required.

Whilst the last two factors should be considered, the first factor is of paramount and overriding importance.

Support and Verification

Where there is doubt regarding the state of a tree and work required, this should be highlighted on the survey form and the query clearly explained. If deemed in the best interest of the WCST, a consultant arborist will be asked to inspect the tree and provide a report.

Survey records

The survey records will be passed to Tim Dicker and kept for action and reference. Trees identified as urgent should be clearly highlighted so that urgent action can be taken where required.

The survey records will be logically and securely stored for future use and reference – this may be through either scanning paper based survey forms or converting them to electronic format, then storing them electronically with backup.

Tree Safety Plan

The plan must be kept up to date based on completed surveys, and tree safety work programmed accordingly.

8. Tree safety work

Work Planning

- Where appropriate work will be carried out using WCST volunteers, though it will often require a contract tree surgeon to complete more complex tasks.
- Work should be planned to avoid sensitive times of year such as the bird nesting season. Where possible tree safety work will be integrated with other work for efficiency purposes.
- The risk assessment for Woodland Work will be referred to as the base for any tree work with a more detailed risk assessment being completed for a specific task and adjusted to suit circumstances.
- Where traffic management is required, this may be coordinated with the appropriate Highways Department and undertaken according to Section 8 guidelines.
- Work by contract tree surgeons will be commissioned through a tender process in line with WCST requirement to obtain three written quotes.

Remedial Work Implementation

- The Tree Work part of the survey form must be filled in when the work has been completed.

This policy will be reviewed on a three-yearly basis.

9. Appendices

The relevant forms used by the Trust are on the following pages in landscape format.

- 1. Risk Assessment*
- 2. Inspection Form template*
- 3. Tree Survey Schedule*
- 4. Site Map*

Risk assessment

| | |
|---|---|
| Time Period Covered: | January 2015 – December 2016 |
| Job: | Tree Safety Inspections |
| People covered by risk assessment: | Surveyor, Committee Members & Trustees. |

| The Hazard | Location of the Hazard | Who could be harmed? | Level of risk | Controls | Implementation/ Monitoring |
|--|------------------------|----------------------|---------------|--|----------------------------|
| Working alone and outdoors – poor weather, exposure etc. | WCST | Surveyor | Low | <ul style="list-style-type: none"> Reschedule survey to period of more settled weather. Always wear a hi- viz vest when adjacent to highway. Carry mobile phone. Notify somebody that you are working alone | • |
| Being Struck by Falling Trees/ Branches. | WCST | Surveyor | Low | <ul style="list-style-type: none"> Monitor windspeeds and weather conditions. If windspeed becomes gusty or excessive review order of work and re-schedule if necessary. Wear hard hat. Notify someone that you are at work | • |
| Struck by vehicles. | On side of highway. | Surveyor | Med | <ul style="list-style-type: none"> If weather conditions or visibility is inclement postpone roadside working. Always wear a class 2 Hi Viz jacket/ sleeved vest. Be aware of traffic speed and dangers. | • |
